

# AL5H series

## Card Lock Variation

## Lever handle variation

\*Please consult Miwa personnel for other lever handle options.

### Infrared Programming

Communication to the AL5H lock for programming and interrogating is fast and efficient using the standard infrared port. There are no programming cables to lose or break for this system.

### Light and sound notification

When the guest enters the room, the lock's light turns green to confirm lock opening. Guest cards can be programmed so that the lock also emits an audible signal confirming the opening of the lock, ideal for sight impaired guests.

### Dust Shutter

Whether installed inside or out, insert locks have problems regarding collecting dust, the AL5H lock has a shutter in the front of the reader that is closed whilst the lock is not in use preventing unwanted dust and dirt from entering the heart of the lock. When a card is inserted, the shutter is raised allowing access to the reader, as the card is pulled out the shutter closes immediately behind it.

### Landed Technology

The smart card reader is utilizing the more reliable landed reader technology, this helps to extend the life of the smart card as well as the read heads themselves.

### Low battery warning

There is nothing worse for a guest than to get to their room and be unable to open the door. Often this is due to staff overlooking changing the batteries in the lock; with the AL5H locking system we have three different warnings should a lock's batteries be getting low. First, when a staff card is used, the green light will flash, also an audible warning is emitted. In case these are not noticed when auditing the staff cards each lock that card has been used in writes its battery level status.

### Option [ Lock Unit For External Installation ]

This special lock has been designed for installations in outdoor or harsh environments, such as coastal areas. The reader controller is coated with resin, providing protection to the essential electronics.
